Monday November 22

Definition: When A and B are sets, we say any subset of $A \times B$ is a **binary relation**. A relation R can also be represented as

- A function $f_{TF}: A \times B \to \{T, F\}$ where, for $a \in A$ and $b \in B$, $f_{TF}((a, b)) = \begin{cases} T & \text{when } (a, b) \in R \\ F & \text{when } (a, b) \notin R \end{cases}$
- A function $f_{\mathcal{P}}: A \to \mathcal{P}(B)$ where, for $a \in A$, $f_{\mathcal{P}}(a) = \{b \in B \mid (a, b) \in R\}$

When A is a set, we say any subset of $A \times A$ is a (binary) relation on A.

For relation R on a set A, we can represent this relation as a **graph**: a collection of nodes (vertices) and edges (arrows). The nodes of the graph are the elements of A and there is an edge from a to b exactly when $(a,b) \in R$.

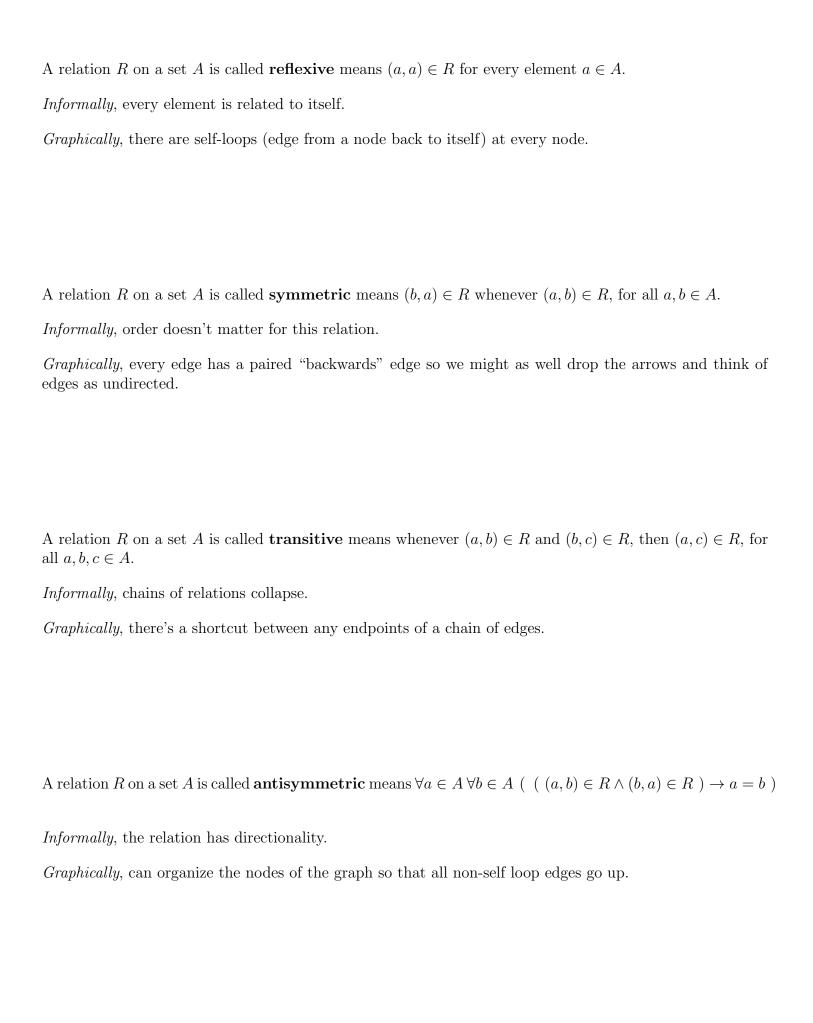

Example: For $A = \mathcal{P}(\mathbb{R})$, we can define the relation $EQ_{\mathbb{R}}$ on A as

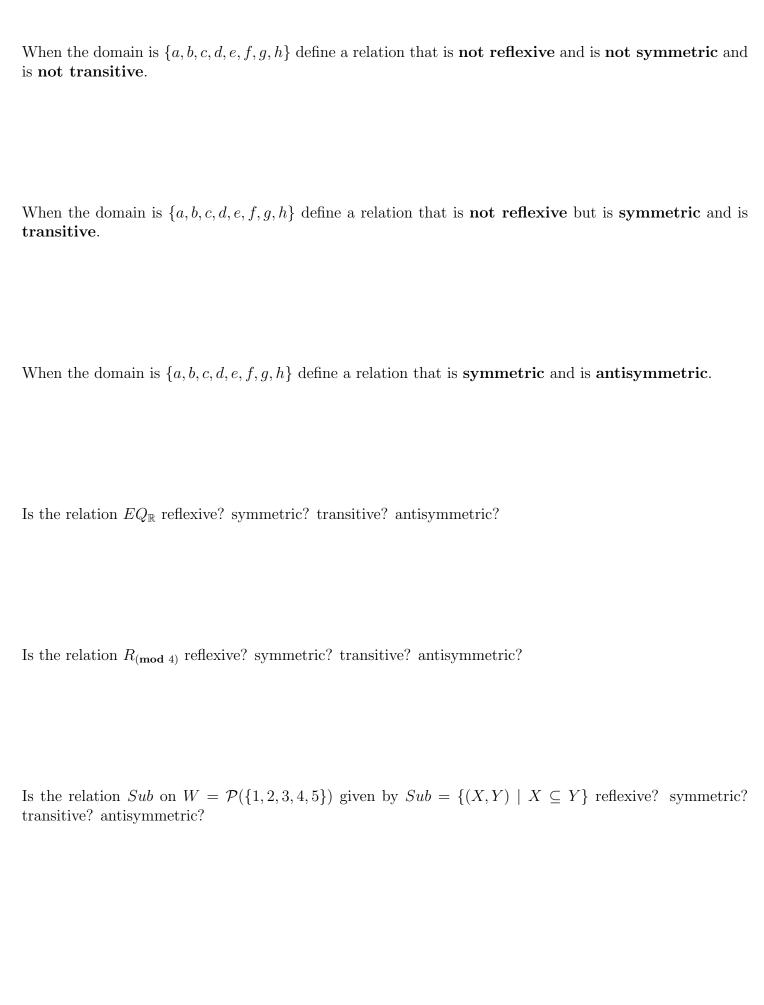

$$\{(X_1, X_2) \in \mathcal{P}(\mathbb{R}) \times \mathcal{P}(\mathbb{R}) \mid |X_1| = |X_2|\}$$

Example: Let $R_{(\mathbf{mod}\ n)}$ be the set of all pairs of integers (a,b) such that $(a\ \mathbf{mod}\ n=b\ \mathbf{mod}\ n)$. Then a is **congruent to** $b\ \mathbf{mod}\ n$ means $(a,b)\in R_{(\mathbf{mod}\ n)}$. A common notation is to write this as $a\equiv b(\mathbf{mod}\ n)$.

 $R_{(\mathbf{mod}\ n)}$ is a relation on the set ______

Some example elements of $R_{(mod 4)}$ are:

A relation is an **equivalence relation** means it is reflexive, symmetric, and transitive.

A relation is a **partial ordering** (or partial order) means it is reflexive, antisymmetric, and transitive.

For a partial ordering, its **Hasse diagram** is a graph whose nodes (vertices) are the elements of the domain of the binary relation and which are located such that nodes connected to nodes above them by (undirected) edges indicate that the relation holds between the lower node and the higher node. Moreover, the diagram omits self-loops and omits edges that are guaranteed by transitivity.

Draw the Hasse diagram of the partial order on the set $\{a, b, c, d, e, f, g\}$ defined as

$$\{(a,a),(b,b),(c,c),(d,d),(e,e),(f,f),(g,g),\\(a,c),(a,d),(d,g),(a,g),(b,f),(b,e),(e,g),(b,g)\}$$

Summary: binary relations can be useful for organizing elements in a domain. Some binary relations have special properties that make them act like some familiar relations. Equivalence relations (reflexive, symmetric, transitive binary relations) "act like" equals. Partial orders (reflexive, antisymmetric, transitive binary relations) "act like" less than or equals to.

Review

1.

Recall that the binary relation $EQ_{\mathbb{R}}$ on $\mathcal{P}(\mathbb{R})$ is

$$\{(X_1, X_2) \in \mathcal{P}(\mathbb{R}) \times \mathcal{P}(\mathbb{R}) \mid |X_1| = |X_2|\}$$

and $R_{(\mathbf{mod}\ n)}$ is the set of all pairs of integers (a,b) such that $(a\ \mathbf{mod}\ n=b\ \mathbf{mod}\ n)$. Select all and only the correct items.

- (a) $(\mathbb{Z}, \mathbb{R}) \in EQ_{\mathbb{R}}$
- (b) $(0,1) \in EQ_{\mathbb{R}}$
- (c) $(\emptyset, \emptyset) \in EQ_{\mathbb{R}}$
- (d) $(-1,1) \in R_{(\text{mod }2)}$
- (e) $(1,-1) \in R_{(\mathbf{mod}\ 3)}$
- (f) $(4, 16, 0) \in R_{\text{(mod 4)}}$

2.

Consider the binary relation on \mathbb{Z}^+ defined by $\{(a,b) \mid \exists c \in \mathbb{Z}(b=ac)\}$. Select all and only the properties that this binary relation has.

- (a) It is reflexive.
- (b) It is symmetric.
- (c) It is transitive.
- (d) It is antisymmetric.

3.

- (a) Consider the partial order on the set $\mathcal{P}(\{1,2,3\})$ given by the binary relation $\{(X,Y)\mid X\subseteq Y\}$
 - i. How many nodes are in the Hasse diagram of this partial order?
 - ii. How many edges are in the Hasse diagram of this partial order?
- (b) Consider the binary relation on $\{1, 2, 4, 5, 10, 20\}$ defined by $\{(a, b) \mid \exists c \in \mathbb{Z}(b = ac)\}$.
 - i. How many nodes are in the Hasse diagram of this partial order?
 - ii. How many edges are in the Hasse diagram of this partial order?

Wednesday November 24

Exploring equivalence relations

A partition of a set A is a set of non-empty, disjoint subsets A_1, A_2, \dots, A_n such that

$$A = \bigcup_{i=1}^{n} A_i = \{x \mid \exists i (x \in A_i)\}$$

An equivalence class of an element $a \in A$ with respect to an equivalence relation R on the set A is the set

$$\{s \in A \mid (a, s) \in R\}$$

We write $[a]_R$ for this set, which is the equivalence class of a with respect to R.

Fact: When R is an equivalence relation on a nonempty set A, the collection of equivalence classes of R is a partition of A.

Also, given a partition P of A, the relation R_P on A given by

$$R_P = \{(x, y) \in A \times A \mid x \text{ and } y \text{ are in the same part of the partition } P\}$$

is an equivalence relation on A.

Recall: We say a is **congruent to** b **mod** n means $(a,b) \in R_{(\mathbf{mod}\ n)}$. A common notation is to write this as $a \equiv b(\mathbf{mod}\ n)$.

We can partition the set of integers using equivalence classes of $R_{(mod 4)}$

$$[0]_{R_{(\text{mod }4)}} =$$

$$[1]_{R_{(\text{mod }4)}} =$$

$$[2]_{R_{(\text{mod }4)}} =$$

$$[3]_{R_{(\text{mod }4)}} =$$

$$[4]_{R_{(\text{mod }4)}} =$$

$$[5]_{R_{(\text{mod }4)}} =$$

$$[-1]_{R_{(\text{mod }4)}} =$$

$$\mathbb{Z} = [0]_{R_{(\mathbf{mod}\ 4)}}\ \cup\ [1]_{R_{(\mathbf{mod}\ 4)}}\ \cup\ [2]_{R_{(\mathbf{mod}\ 4)}}\ \cup\ [3]_{R_{(\mathbf{mod}\ 4)}}$$

Integers are useful because they can be used to encode other objects and have multiple representations. However, infinite sets are sometimes expensive to work with computationally. Reducing our attention to a partition of the integers based on congrunce mod n, where each part is represented by a (not too large) integer gives a useful compromise where many algebraic properties of the integers are preserved, and we also get the benefits of a finite domain. Moreover, modular arithmetic is well-suited to model any cyclic behavior.

Lemma: For $a, b \in \mathbb{Z}$ and positive integer n, $(a, b) \in R_{(\mathbf{mod}\ n)}$ if and only if n|a - b.

Application: Cryptography

Definition: Let a be a positive integer and p be a large¹ prime number, both known to everyone. Let k_1 be a secret large number known only to person P_1 (Alice) and k_2 be a secret large number known only to person P_2 (Bob). Let the **Diffie-Helman shared key** for a, p, k_1, k_2 be $(a^{k_1 \cdot k_2} \mod p)$.

Idea: P_1 can quickly compute the Diffie-Helman shared key knowing only a, p, k_1 and the result of $a^{k_2} \mod p$ (that is, P_1 can compute the shared key without knowing k_2 , only $a^{k_2} \mod p$). Similarly, P_2 can quickly compute the Diffie-Helman shared key knowing only a, p, k_2 and the result of $a^{k_1} \mod p$ (that is, P_2 can compute the shared key without knowing k_1 , only $a^{k_1} \mod p$). But, any person P_3 who knows neither k_1 nor k_2 (but may know any and all of the other values) cannot compute the shared secret efficiently.

Key property for *shared* secret:

$$\forall a \in \mathbb{Z} \, \forall b \in \mathbb{Z} \, \forall g \in \mathbb{Z}^+ \, \forall n \in \mathbb{Z}^+ ((g^a \mod n)^b, (g^b \mod n)^a) \in R_{(\mathbf{mod} \ n)}$$

Key property for shared *secret*:

There are efficient algorithms to calculate the result of modular exponentiation but there are no (known) efficient algorithms to calculate discrete logarithm.

 $^{^{1}}$ We leave the definition of "large" vague here, but think hundreds of digits for practical applications. In practice, we also need a particular relationship between a and p to hold, which we leave out here.

Review

1.

Fill in the blanks in the following proof that, for any equivalence relation R on a set A,

$$\forall a \in A \ \forall b \in A \ ((a,b) \in R \leftrightarrow [a]_R \cap [b]_R \neq \emptyset)$$

Proof: Towards a (a) ______, consider arbitrary elements a, b in A. We will prove the biconditional statement by proving each direction of the conditional in turn.

Goal 1: we need to show $(a,b) \in R \to [a]_R \cap [b]_R \neq \emptyset$ Proof of Goal 1: Assume towards a (b) ______ that $(a,b) \in R$. We will work to show that $[a]_R \cap [b]_R \neq \emptyset$. Namely, we need an element that is in both equivalence classes, that is, we need to prove the existential claim $\exists x \in A \ (x \in [a]_R \land x \in [b]_R)$. Towards a (c) ______, consider x = b, an element of A by definition. By (d) ______ of R, we know that $(b,b) \in R$ and thus, $b \in [b]_R$. By assumption in this proof, we have that $(a,b) \in R$, and so by definition of equivalence classes, $b \in [a]_R$. Thus, we have proved both conjuncts and this part of the proof is complete.

Goal 2: we need to show $[a]_R \cap [b]_R \neq \emptyset \rightarrow (a,b) \in R$ Proof of Goal 2: Assume towards a (e)______ that $[a]_R \cap [b]_R \neq \emptyset$. We will work to show that $(a,b) \in R$. By our assumption, the existential claim $\exists x \in A \ (x \in [a]_R \land x \in [b]_R)$ is true. Call w a witness; thus, $w \in [a]_R$ and $w \in [b]_R$. By definition of equivalence classes, $w \in [a]_R$ means $(a,w) \in R$ and $w \in [b]_R$ means $(b,w) \in R$. By (f)______ of R, $(w,b) \in R$. By (g)______ of R, since $(a,w) \in R$ and $(w,b) \in R$, we have that $(a,b) \in R$, as required for this part of the proof.

Consider the following expressions as options to fill in the two proofs above. Give your answer as one of the numbers below for each blank a-c. You may use some numbers for more than one blank, but each letter only uses one of the expressions below.

i exhaustive proof vi proof by contrapositive vii proof by universal generalization vii proof by contradiction viii proof of existential using a witness viii reflexivity iv proof by cases ix symmetry v direct proof x transitivity

2.

Modular exponentiation is required to carry out the Diffie-Helman protocol for computing a shared secret over an unsecure channel.

Consider the following algorithm for fast exponentiation (based on binary expansion of the exponent).

Modular Exponentation

```
procedure modular\ exponentiation\ (b:\ integer;

n=(a_{k-1}a_{k-2}\dots a_1a_0)_2\ ,\ m:\ positive\ integers)

x:=1

power :=b\ mod\ m

for i:=0\ to\ k-1

if a_i=1\ then\ x:=(x\cdot power)\ mod\ m

power :=(power\cdot power)\ mod\ m

return x\ \{x\ equals\ b^n\ mod\ m\}
```

- (a) If we wanted to calculate 3^8 **mod** 7 using the modular exponentation algorithm above, what are the values of the parameters b, n, and m? (Write these values in usual, decimal-like, mathematical notation.)
- (b) Give the output of the $modular\ exponentiation$ algorithm with these parameters, i.e. calculate $3^8\ mod\ 7$. (Write these values in usual, decimal-like, mathematical notation.)

Friday November 26

No class, in observance of Thanksgiving holiday.
